

Notification

Within the Interreg Project SeeWandel various NGS library preparation and sequencing experiments with a budget of up to 48,000 EURO are planned in the subproject P5 "Daphnia Resilience". Due to the experimental character of the project, methodology and requirements of the single experiments will require constant updating and coordination. Suitable methods may include standard (~1 ug DNA) and low input library preparation (< 1ng DNA) for Illumina short read sequencing, library preparation for linked read sequencing, Illumina short read sequencing (2x150 bp), library preparation for long read sequencing and long read sequencing.
